

Our Hollow Earth

The Earth has the shape of a toroid with polar openings

What shape does the Earth have?

On one of my Internet radio interviews, I was asked by the host, what test could be conducted should a person wish to prove that the Earth is NOT hollow?

My answer was that he could dig a hole to the center of the earth. If that could be done, then a gravimeter lowered down that hole would measure a gradual decrease in the acceleration of gravity from the average surface acceleration of 980.665 cm/sec² to zero at the center of the earth.

Should a gravimeter be lowered down the hole, it would show that the acceleration of gravity decreases faster than if the center of gravity is located in the center of the earth. This would indicate that the Earth is hollow.

Such an experiment was carried out in a Greenland Ice Hole as reported in the February 27, 1989 Physical Review Letters journal, page 986.

What the experiment discovered was that at a depth of 2.037 kilometers from the surface of the hole, their gravimeter measured 167.42 LESS miliGals in the acceleration of gravity than if the center of gravity were located in the center of the Earth, proving that the center of gravity is closer to the surface, which would be the case if the earth is hollow.

In the proposed hole to the center of the Earth, if the Earth is Hollow, the hole will not be able to reach the center of the earth because it will end at the Inner Surface of the Earth's shell. The hole may well pay for itself by possibly finding gold, silver, diamonds or other precious ores in the process of digging the hole. After digging the hole and installing an elevator, many people would pay for the privilege of going to the center of gravity, where they could float around in the air, even if it turns out that the Earth is not full of matter, but is instead hollow.

When the elevator reaches the center of gravity, the door could be opened and people could attach a tether to their bodies secured to the elevator and float out into zero gravity. Unlike in outer space where astronauts need a space suit to provide air and protection from the Sun's harmful rays and the vacuum of space, the people floating in the air at the center of gravity would be in their regular clothes, and because of the phosphorescent glow in the air, as reported by those that have been deep into earth's caverns, they would be able to see clearly where they are floating.

The Inner Earth Guide in the book ETIDORPHA, told William Morgan (known as "I-Am-The-Man") that the center of gravity in the Earth's 800-mile thick shell is located at a depth of 700 miles from the outer surface. This could be verified in such a hole. At that depth from the outer surface, the center of gravity would be reached where the acceleration of gravity would be zero.

The center of gravity in an Earth having matter throughout its diameter would be a point in the center of the Earth. But if the Earth is hollow, the center of gravity would be a sphere at a depth where the center of gravity is located. The Inner Earth Guide reported that the central sphere of gravity in the Earth's shell is 700 miles down from the outer surface of the planet. When William Morgan and his

Inner Earth Guide reached the Earth's center of gravity, they were floating in the air of the cavern.

As confirmed by the Greenland Icehole Experiment, the Earth's shell center of gravity is closer to the surface than scientists previously thought. If the center of gravity is not in the center of the Earth, but closer to the surface, this proves conclusively that the preponderance of the Earth's mass is in its shell, which means that our Earth is hollow. The Inner Earth Guide in the book ETIDORPHA, told William Morgan that the shell of the planet is about 800 miles thick. Which means that the earth is 50% hollow in volume.

Explorers that have been to Our Hollow Earth tell us that near the poles are located giant holes that lead into the hollow interior of the planet. My friend Lord Ivars, was told by an airline pilot that he and many of his airline pilot buddies have seen these holes at the poles, that they are so big that the airlines cannot fly over them because of the lack of gravity in the holes, that it would be like trying to fly into outer space to try to fly over the holes they are so large. Admiral Byrd, in his flight into the South Polar Opening in 1946 reported that the curvature of the Earth gradually curves into a giant hole in the earth that is 125 miles in diameter at the neck of the opening half-way through the opening. In 1926 he flew down into the North Polar Opening and in 1927 he flew all the way through the North Polar Opening.

This evidence indicates that the true shape of Our Hollow Earth is more like a toroid, like a donut, that has holes at the polar axis of the Earth. The Earth has been tipped on its axis since its creation so that today the polar openings are not at the poles, but about 350 miles to one side of the geographic poles centered over 85 degrees North and South latitude. The North Polar Opening is located toward the Russian side of the pole at 85 N Latitude, 130 E Longitude, and the South Polar Opening is located towards the Atlantic side of the pole at 85 S Latitude, 50 W Longitude.

Suspended in the hollow of the Earth is an Inner Sun about 600 miles in diameter. The Inner Sun most likely is also hollow, and is divided between its day and night sides. Olaf Jansen, who went to Our Hollow Earth in 1829 reported that the Inner Sun has a bright shining cloud that covers its daylight side and has a reddish-brown color on its night side. Also on its night side is a large circular opaque area that has holes in it that let bright light shine through at night that appear as stars in the night sky. The Inner Sun is 23 times larger in apparent size as viewed from the Inner Surface of Our Hollow Earth than the apparent size of our outer Sun as viewed from our Outer Surface. The Inner Sun rotates at a rate of about 800 years for one rotation. Therefore, as the Earth rotates about the Inner Sun, the bright shining cloud side appears in the morning in the East and goes behind the Inner Sun in the evening. There is a slight temperature difference between the day and night sides of the Inner Sun also that gives rise to a breeze that comes up in the evening on the Inner Surface, and which also causes a mist to rise up off the ground and water the face of the ground resulting in the abundant plant, animal and human life that exists in Our Hollow Earth.
